    </a>
  </p>
```

Technical Overview

Web Servers and Internet Services

A web server is a computer system that stores and delivers web content to users over the internet through a web browser such as Google Chrome. The web browser sends a request to the web server, which processes the request and sends back files such as HTML, CSS, images and JavaScript. The browser then displays the website to the user (SolarWinds, n.d.).

For my website, the GitHub repository **carleneattard7105.github.io** stores HTMLs (**index.html**, **contact.html**, **articles.html**), CSS (**style.css**) and the image files. GitHub Pages hosts these files and makes the website accessible online.

Domain Names, URLs and IP Addresses

Domain names are human-readable website addresses linked to Internet Protocol (IP) addresses that identify servers or devices. The Domain Name System (DNS) translates a domain name into its associated IP address, allowing the browser to locate the correct web server (Yusuf, 2025; Cloudflare, n.d.). A Uniform Resource Locator (URL) then identifies the location of the specific resource on the internet.

For my website, the URL <https://carleneattard7105.github.io/> provides access to my published website. The github.io domain is used by GitHub Pages, while carleneattard7105 identifies my user site, by following the format carleneattard7105.github.io (GitHub, 2026).

HTTP:// and HTTPS://

GeeksforGeeks (2026) states that URLs often start with `http://` or `https://`, which indicate how data is transferred between a web browser and web server. **Hypertext Transfer Protocol (HTTP)** allows browsers to request resources from web servers. However, HTTP is less secure because the data is transferred without encryption, and could potentially be intercepted by a third party (GeeksforGeeks, 2026; SecurityScorecard, 2025).

In contrast, **Hypertext Transfer Protocol Secure (HTTPS)** provides more secure communication by using Transport Layer Security (TLS) to encrypt data between the browser and web server. This helps prevent third parties from reading or modifying information while it is being transmitted (SecurityScorecard, 2025).

My GitHub Pages website uses **HTTPS**, shown by `https://` at the beginning of its published URL. GitHub (2026) states that sites using the `github.io` domain are served over HTTPS automatically.

Website Hosting

I published my website using GitHub Pages by creating the public repository `carleneattard7105.github.io` and uploading my completed HTML, CSS and image files. My homepage is stored as `index.html`. I then opened Settings → Pages, selected Deploy from a branch, and chose the publishing branch.

Once published, the website became publicly accessible, and any future changes can be committed to the repository and published through GitHub Pages.
